

## **Tectonostratigraphic and Geodynamic Linkage Between the Orogenic Systems of the Hellenides and the Pontides/Taurides**

Convener: Dimirios Papanikolaou

This issue has received very little attention up to now and several papers are published with tectonic and/or geodynamic correlations not supported by field evidence in the two countries. I think that papers discussing the terranes and tectonic units in the two countries as well as the lateral correlation of metamorphism, magmatism and deformation can contribute significantly to a better understanding of the area. In the program it is essential to include enough time for discussions.
